**Purpose:** The NH Drug Monitoring Initiative (DMI) is a holistic strategy to provide awareness and combat drug distribution and abuse. In line with this approach the DMI will obtain data from various sources (to include, but not limited to, Public Health, Law Enforcement, and EMS) and provide monthly products for stakeholders as well as situational awareness releases as needed.

**(U) Carfentanil**

**(U) Significance:**
Carfentanil has been found in New Hampshire for the first time and is extremely potent. On 4/25/2017 the medical examiner confirmed that carfentanil can be linked to three known deaths in New Hampshire. In addition there were three unrelated powder submissions to the state lab that tested positive for carfentanil. This provides a significant provider safety risk. This drug can be inhaled or absorbed when in the powder form. If drug paraphernalia is found at an emergency scene approach the situation with EXTREME CAUTION.

**(U) Overview:**
Carfentanil is a synthetic opioid approximately 10,000 times more potent than morphine and 100 times more potent than fentanyl. The presence of carfentanil in illicit U.S. drug markets is cause for concern, as the relative strength of this drug could lead to an increase in overdoses and overdose-related deaths, even among opioid-tolerant users.

**(U) Lethality:**
Carfentanil is used as a tranquilizing agent for elephants and other large mammals. The lethal dose range for carfentanil in humans is unknown; however, carfentanil is approximately 100 times more potent than fentanyl, which can be lethal at the 2-milligram range (photograph), depending on route of administration and other factors.

**(U) Treatment:**
Carfentanil can quickly reach toxic levels in the human body. Exposure to carfentanil causes symptoms similar to those of opioid toxicity and overdose including pinpoint pupils, shallow breathing, dizziness, lethargy, loss of consciousness, nausea/vomiting, weak pulse, cold and clammy skin and heart failure. **Naloxone will reverse a carfentanil overdose, but it requires multiple doses according to reports from emergency personnel.**
(U) Public Safety Information:  
*Exercise extreme caution:* Only properly trained and outfitted law enforcement professionals should handle any substance suspected to contain fentanyl or a fentanyl-related compound. If encountered, contact local authorities.

*Beware of any signs of exposure:* Symptoms include: respiratory depression or arrest, drowsiness, disorientation, sedation, pinpoint pupils, and clammy skin. The onset of these symptoms usually occurs within minutes of exposure.

*Seek IMMEDIATE medical attention:* Carfentanil and other fentanyl-related substances can work very quickly, so in the cases of suspected exposure, it is important to call EMS immediately. If inhaled, move the victim to fresh air. If ingested and the victim is conscious, wash out the victim’s eyes and mouth with cool water.

*Be ready to administer naloxone in the event of exposure:* Naloxone is an antidote for opioid overdose. Immediately administering naloxone can reverse an overdose of carfentanil, fentanyl, or other opioids, although multiple doses of naloxone may be required. Continue to administer a dose of naloxone every 2-3 minutes until the individual is breathing on his/her own for at least 15 minutes or until EMS arrives.

*Remember that carfentanil can resemble powdered cocaine or heroin:* If you suspect the presence of carfentanil or any synthetic opioid, do not disturb the substance, as this could lead to accidental exposure.

---

**Be Part of The Solution**

In 2015, 1,000 Americans a day were treated in emergency departments for not using prescription opioids as directed, and 91 Americans died every day from an opioid overdose. The information you provide will be properly vetted before an investigation is started. Your call may be anonymous if you choose.

*You can save a life.*
