ACKNOWLEDGMENTS

The New Hampshire PRAMS Project Team would like to acknowledge the CDC PRAMS team for their technical assistance and support, namely our project officers Denise D'Angelo and Megan O'Connor, and statisticians Phil Hastings and Brian Morrow. Thanks also to the New Hampshire Division of Vital Records Administration, and notably Data Entry Operator Wendy Kizer, for ongoing diligence in ensuring completeness of the sampling frame.

Within the New Hampshire Department of Health and Human Services, Division of Public Health Services, we thank statistician Dr. Michael Laviolette in the Bureau of Health Statistics and Informatics for his able assistance. Thanks also to the NH PRAMS Steering Committee for their ongoing guidance and support.

Sincere thanks and appreciation also go to the New Hampshire women who participated in PRAMS, for sharing their experiences and allowing us to use this information.

Executive Summary

Since 2013, New Hampshire's Pregnancy Risk Assessment Monitoring System (PRAMS) has been collecting statewide data from resident women who have a live birth, within two to six months after giving birth. Topics include maternal behaviors, attitudes and experiences just prior to the pregnancy, during pregnancy, and shortly after delivering their baby. This data book compares the answers of women who have a low birth weight baby with those who have a normal (or higher) birth weight baby for births occurring 2013-2015.

It is important to note that these comparisons may show differences between groups that could change (weaken, strengthen, disappear or reverse) if other factors were considered at the same time. The purpose of this report is to make the data available in a way that encourages further exploration of these relationships. Interested researchers may request de-identified data using the forms linked on the NH PRAMS website.

Smoking tobacco during pregnancy is well-known to have detrimental impacts on birth outcomes including birth weight. Among NH births, smoking was more frequent in the low birth weight group, in all perinatal time periods: two years before the pregnancy, three months before the pregnancy, in the last trimester, and at the time of the survey (postpartum).

A larger percentage of women who had a low birth weight baby were in the lower income group and in the lowest education group, than women with a normal birth weight baby. Socioeconomic status is strongly related to health outcomes through a variety of factors such as access to health services, physical environment and complex differences in the social and economic structures of our society. These factors, often referred to as the social determinants of health, are a source of health inequities.

Differences in breastfeeding were also noted, with fewer women in the low birth weight group breastfeeding more than eight weeks, and also fewer breastfeeding at the time of survey (2-6 months postpartum). The most frequently cited reason among all women for breastfeeding discontinuation was not producing enough milk.

Around half of the women with a low birth weight baby reported having had a postpartum home visitor. Postpartum depression was reported by nearly one in five women with a low birth weight baby, compared to approximately one in ten women with a normal birth weight baby.

More summary information can be found in the Summary Highlights section, and the data tables at the end of this report contain detailed information.

New Hampshire PRAMS Pregnancy Risk Assessment Monitoring System 2013-2015 Data Book Stratified by Birth Weight

PURPOSE

The purpose of this report is to provide a quick reference to basic findings that researchers and practitioners may find useful when deciding whether to further investigate any of these indicators related to pregnancy.

INTRODUCTION

The Pregnancy Risk Assessment Monitoring System (PRAMS) is a surveillance project of the Centers for Disease Control and Prevention (CDC) conducted through cooperative agreements with state health departments. PRAMS collects state-specific, population-based data on maternal attitudes and experiences shortly before, during, and shortly after pregnancy. The goal of the PRAMS project is to improve the health of mothers and infants by reducing adverse outcomes such as low birth weight, infant morbidity and mortality, and maternal morbidity.

Initiated in 1987 as part of the CDC's initiative to reduce infant mortality and low birth weight, in the period 2013-2015 PRAMS was active in 40 states plus New York City, representing 78% of all US live births. Because all participating states follow a standard protocol and ask identical Core Questions, results can be compared across states as well as aggregated into a national snapshot of maternal and infant health.

Findings from PRAMS are used to enhance understanding of maternal behaviors and their relationship with adverse pregnancy outcomes. PRAMS data are also used to plan and evaluate health programs and to inform policymakers and the general public. NH PRAMS collects data on several factors pertaining to Title V Maternal and Child Health priorities, including access to health care, substance use or misuse, and safe sleep practices.

METHODOLOGY

Sampling and Data Collection

PRAMS-eligible women are all New Hampshire residents who have a live birth. Approximately one in 12 New Hampshire-resident women are randomly sampled between two and six months after giving birth. New Hampshire includes out-of-state births to New Hampshire residents in the sampling plan due to the high proportion of births occurring out-of-state (8.4% in 2013; 9.2% in 2014; 9.0% in 2015) and their potentially higher risk profile: women may go out of state in order to utilize a higher level of care when this is closer to their home than higher level care in New Hampshire.

The annual PRAMS samples of women who have had a recent live birth are drawn from the State's birth certificate file. New Hampshire PRAMS samples approximately 1,000 women per year. Each month, a random

sample is drawn of approximately 85 women who had a live birth; the sample is stratified by birth weight, with women having a low birth weight baby (less than 5.5 pounds) sampled at a higher rate to ensure adequate data are available from this smaller, but higher risk population. In this report, very low and low birth weights are grouped together (LBW), and the normal and high birth weights comprise the second, comparison group (NBW), with 5.5 pounds as the demarcation between the two groups.

Data collection procedures and instruments are standardized to allow comparisons between states as well as multi-state analyses. All states administer a group of Core Questions, and states select their own Standard Questions according to their needs and priorities. States may also write their own state-specific questions; New Hampshire-specific questions in the Phase 7 survey (2013-2015) covered arsenic in well water, use of text messaging, and use of social media for information on pregnancy issues.

After a sample is drawn, a series of mailings is implemented over the next six weeks. The PRAMS questionnaire contains items asking about the early postpartum period; thus, the mailings are timed to ensure that all women will be able to respond for this timeframe. The first mailing is a letter to introduce PRAMS to the mother and to inform her that a questionnaire will follow. Five days later, a questionnaire packet is mailed. This packet contains the 75-item survey booklet plus an informed consent document, calendar, resource list, and a coupon for a birth certificate as a reward for completion of the survey. Ten days after the initial packet is mailed, a tickler serving as a thank you and reminder note is sent. Mothers who did not return their questionnaire in the next two weeks are sent a second questionnaire packet. All remaining non-respondents are mailed a third questionnaire packet two weeks after the second.

After the mailings, a series of telephone calls are made to all women who did not return a mailed survey; over the next four weeks up to 15 attempts are made to contact each woman. Telephone calls are made at various times of the day and on different days of the week. Call-back interviews are arranged as needed to accommodate the mother's schedule. The full data collection cycle from the mailing of the pre-letter to the end of telephone follow-up is 85 days.

Survey Results and Data Analysis

The CDC recommends that states obtain a response rate of at least 60% for analysis of PRAMS data. New Hampshire's weighted response rates were 67% in 2013, 64.0% in 2014, and 62% in 2015, representing a three-year total of 36,340 resident births; of these, the weighted frequency estimate for low birth weights was 2,065 and for normal birth weights 34,275.

Data collected through PRAMS are linked to birth certificate data, which allows the survey data to be weighted to reflect the total birth population and not just the survey respondents. Sampling, non-response and non-coverage weights are applied to the data in order to make the results generalizable to the State's entire population of women delivering live born infants during each study period (one calendar year). Population estimates are obtained by using the analysis weights and survey design variables. Analysis was done using SAS survey analysis procedures for complex survey design (version 9.4).

Interpretation of text and tables

A combined three-year percentage estimate is reported for each indicator in the PRAMS survey. In addition, annual percentage estimates are provided for indicators for which the annual confidence intervals showed a significant difference by year, within either the low birth weight (LBW) group or the normal/high birth weight (NBW) group.

Because of the survey design, a margin of error is computed, which is the 95% confidence interval (CI). A 95% CI indicates 95% certainty that the true (unknown) population value is included within this range.

Data are suppressed and represented with an asterisk (*) when the sampled number of 'Yes' responses was less than ten, or when the relative standard error of the estimate is large ($\geq 30\%$ of the estimate), which indicates that the estimate has high variability and is unreliable.

LIMITATIONS

The PRAMS survey is subject to limitations. Non-response bias may be present if the sampled women who did not participate were systematically different from those who did and if the weighting process did not fully account for this. PRAMS data are self-reported and may be subject to social desirability bias or inaccuracies, leading to reporting bias. The questionnaire is administered two to six months after the birth occurs, so recall bias should be limited but cannot be excluded. Mode bias also is possible if mothers answer differently depending on whether they completed the mail survey or the telephone survey. The survey is available only in English, so mothers with limited English proficiency may not be able to participate.

This data book presents findings stratified by birth weight (LBW, defined as low or very low vs. NBW, defined as normal or high). The findings show simple associations between various indicators and the birth weight outcomes, and are not intended to imply causal relationships. Causation cannot be considered without examining the effects of possible confounders such as plurality, preterm birth, small for gestational age, previous births (if any), maternal age, education, socioeconomic status, and the content and/or frequency of prenatal care, to name a few. Causation and the role of confounders are beyond the intended scope of this data book.

[this page intentionally left blank]

Summary Highlights

These bullet points provide an overview of the findings on various indicators. **They are not an exhaustive summary of all findings**; rather, they focus on some indicators that show a significant difference between the LBW group and the NBW group. These differences may not be valid upon adjustment for confounders. They also may not have clinical significance.

The reader should refer to the data tables in the body of the report for more complete information; data points that are not featured in this summary section may still be of interest.

NB: Each bullet point cites the question to which it refers; e.g., [Q1] = summary finding from Question 1.

Pre-pregnancy

- There were no significant differences in the **BMI** groupings or **age** groupings of the women who had a low birth weight baby compared with those who had a normal birth weight baby. [Q2, Q3]
- Having had a **previous live birth** was proportionately more common among women who had a normal birth weight baby (54.8%) than among those who had a low birth weight baby (47.8%). [Q4]
- Conversely, having had a **previous low birth weight** baby was proportionately more common among women giving birth to a low birth weight baby (26.1%) than among women who had a normal birth weight baby (8.7%). [Q5]
- Likewise, having had a **previous preterm birth** was proportionately more common among women who had a low birth weight baby (23.6%) than among those who had a normal birth weight baby (12.1%). [Q6]
- **Health-related behaviors:** Women who had a low birth weight baby, compared with those who had a normal birth weight baby, reported less dieting and exercise before pregnancy, and more instances of getting checked for diabetes, high blood pressure or depression. [Q7]
- Women who had a low birth weight baby reported less **insurance coverage from work**, and more **Medicaid** coverage (59.5%, 17.5%), than women who had a normal birth weight baby (66.1%, 11.5%). [Q8]
- Women who had a low birth weight baby reported proportionately more diagnoses of **high blood pressure** and **depression** (8.5%, 21.9%) than women who had a normal birth weight baby (3.1%, 15.8%). [Q11]
- There were no differences in **pregnancy intendedness** between the two groups [Q12], nor in whether or not they were trying to conceive. [Q14]

During Pregnancy

- Among women who had a low birth weight baby, proportionately fewer had a **Kotelchuck score** (adequacy of prenatal care utilization, based on initiation of care and the number of visits) of 'Adequate' (19.3%) and more had a Kotelchuck score of 'Adequate plus' (68.7%) than the women who had a normal birth weight baby (47.5% Adequate; 38.7% Adequate plus). [after Q18]
- Women who had a low birth weight baby reported getting **prenatal care as early as they wanted** less often (83.3%) than women who had a normal birth weight baby (88.6%). [Q19]

- The most frequently cited **reason for not getting early prenatal care** was not knowing that she was pregnant, reported by 53.1% of women who had a low birth weight baby, and by 38.6% of women with a normal birth weight baby. [Q20]
- Among women who had a low birth weight baby, 58.4% reported that their prenatal care was paid by **health insurance from work**, and 38.6% by **Medicaid**; for women who had a normal birth weight baby, these figures were 65.5% from work and 30.7% from Medicaid. [Q21]
- Between the two birth weight groups, there were several significant differences reported in the content of **information received during prenatal care visits**, such as information about the effects of smoking on the baby, or information on breastfeeding. [Q22]
- 20.9% of women with a low birth weight baby took **childbirth classes**, compared to 25.6% of women with a normal birth weight baby. [Q28]
- A significantly larger percentage of women in the LBW group were **enrolled in WIC** during pregnancy, than women in the NBW group (34.9% vs. 27.2%). [Q31]
- **Gestational diabetes** was reported by a larger percentage of women in the LBW group than in the NBW group (11.0% vs. 7.7%). [Q31]
- **Smoking in the two years before pregnancy** was reported by 40.5% of women who had a low birth weight baby, and by 25.5% of women who had a normal birth weight baby. [Q32]
- 33.8% of women in the LBW group and 22.9% of women in the NBW group reported **smoking in the three months just before the pregnancy**. [Q33]
- 23.2% of those in the LBW group and 10.3% of those in the NBW group **smoked in the last three months of pregnancy**. [Q34]
- 27.1% of those in the LBW group and 13.7% of those in the NBW group reported **smoking at the time of the survey** (2-6 months after giving birth). [Q35]
- There was no significant difference in rates of **drinking alcohol in the previous two years** between women who had a low birth weight baby (78.9%) and those who had a normal birth weight baby (80.5%). [Q36]
- However, women who had a low birth weight baby reported less **drinking in the three months before pregnancy** than women in the normal birth weight group (66.6% vs. 71.7%). [Q37]
- Women who had a low birth weight baby also reported less **drinking in the last three months of pregnancy** (6.8% vs. 11.5%). [Q38]
- Several significant differences in rates of **stressors experienced during pregnancy** were reported, with women having had a low birth weight baby reporting higher rates than women having had a normal birth weight baby, in each instance. [Q39]
- Rates of **intimate partner violence** were higher among women who had a low birth weight baby than those who had a normal birth weight baby: 3.9% vs. 2.1% before pregnancy, and 3.8% vs. 1.2% during pregnancy. [Q40, Q41]
- In both groups of women, approximately 40% reported having their **labor induced**; among women with a low birth weight baby the most frequently cited reason was a pregnancy complication (45.4%, vs. 16.8% among women in the NBW group); the most often cited reason among women with a normal birth weight baby was being past the due date (35.2%; for women in the LBW group this data point was too small to report). [Q44]

- There were several significant differences reported in health care worker **advice regarding smoking** between women who ultimately had a low birth weight baby and those who had a normal birth weight baby. [Q68]

Postpartum

- 57.1% of babies of low birth weight were placed in an **intensive care unit (NICU)**, compared to 6.4% of babies of normal birth weight. [Q46]
- 100% of LBW babies and 99.7% of NBW babies were alive at the time of survey. [Q48]
- Among all women (not just those who initiated breastfeeding):
 - ❖ 46.6% of those who had a low birth weight baby were **breastfeeding at the time of survey** (2-6 months postpartum), compared with 57.1% of those who had a normal birth weight baby. [Q51]
 - ❖ 57.1% of those who had a low birth weight baby **breastfed more than 8 weeks**, compared with 63.9% of those who had a normal birth weight baby [Q52]
- Among all women who initiated but had stopped breastfeeding by the time of survey, the most frequently cited **reason for discontinuation** was not producing enough milk: 55.9% among those with a low birth weight baby, and 49.6% of those with a normal birth weight baby (no statistically significant difference between LBW and NBW groups). [Q53]
- Other reasons cited for discontinuation (with a statistically significant difference) were that milk didn't satisfy baby (27.9% in LBW group, 43.5% in NBW group), and sore nipples (9.7% in LBW group, 29.7% in NBW group). [Q53]
- There were several statistically significant differences between groups in hospital norms, hospital staff behavior or teaching, and health care worker advice or instruction. [Q54, Q55]
- Approximately half of women with a low birth weight baby (50.7%) and nearly one-third of women with a normal birth weight baby (31.0%) had a **home visitor** postpartum. [Q57]
- A smaller percentage of women with a low birth weight baby were using **postpartum contraception** than women with a normal birth weight baby (76.8% vs. 82.7%). [Q58]
- Proportionately fewer women who had a low birth weight baby had a **postpartum checkup** than women who had a normal birth weight baby (88.7% vs. 93.2%). [Q61]
- A combined measure of **postpartum depression** shows that 18.8% of women who had a low birth weight baby scored positive for depression, compared to 11.0% of women who had a normal birth weight baby. [Q62, Q63]
- Postpartum, a smaller percentage of women in the LBW group compared to the NBW group had **insurance from work** (56.0% vs. 63.1%), and a larger proportion were enrolled in **Medicaid** (29.2% vs. 21.7%). [Q64]

Other points

- **Home safety:** A higher proportion of women who had a low birth weight baby than those who had a normal birth weight baby reported knowing infant CPR (67.7% vs. 62.6%), and having the poison control phone number accessible in their homes (76.9% vs. 72.0%). [Q69]
- A smaller percentage of women who had a low birth weight baby always **used a seatbelt** during pregnancy, than women who had a normal birth weight baby (78.9% vs. 85.8%). [Q69]
- Among women who had a low birth weight baby, **co-sleeping with the new baby** was reported by 23.1% “Sometimes” and by 26.1% “Rarely”; among women who had a normal birth weight, these data points were 17.2% “Sometimes,” and 30.5% “Rarely.” [Q70]
- There was no significant difference in the use of **text messaging** between both groups of women (approximately 95% each). [Q71]
- 49.1% of women who had a low birth weight baby were in the category of 0-185% of the **Federal Poverty Level**, compared to 40.7% of women who had a normal birth weight baby. [Q73, Q74]
- 60.5% of women who had a low birth weight baby were **married**, compared to 65.5% of women who had a normal birth weight baby.
- Among women who had a low birth weight baby, 11.6% had less than 12 years of **education**, and 65.4% had more than 12 years of education; among women who had a normal birth weight baby, these figures were 6.5% (less than 12 years) and 71.4% (more than 12 years).

New Hampshire 2013-2015 Survey Topics and Questions (Phase 7)

Alcohol and drug use		Question
Alcohol		
Any alcohol use in the past 2 years		36
Alcohol use in the 3 months before pregnancy		37
Alcohol use in the last trimester of pregnancy		38
Advice during prenatal visits regarding effects of alcohol on baby		22d
Illegal drugs		
Prenatal care health worker informed how illegal drugs could affect baby		22g
Breastfeeding Advice		Question
Breastfeeding advice during prenatal care		22c
Breastfeeding advice at birthing hospital		54a
Hospital staff helped me learn how to breastfeed		54c
Hospital staff advised to breastfeed whenever baby wanted		54g
Hospital gave a breast pump to use		54h
Hospital gave a gift pack with formula		54i
Hospital gave a phone number to call for help with breastfeeding		54j
Hospital staff gave my baby a pacifier		54k
After birth, health care worker offered help or information about breastfeeding		55a
Breastfeeding Behaviors		Question
Breastfed in first hour after baby was born		54d
Breastfed in the hospital		54e
Baby fed only breast milk at the hospital		54f
Ever breastfed or pumped breast milk		50
Currently breastfeeding or pumping breast milk		51
Duration of breastfeeding		52
Reasons for discontinuation of breastfeeding		53
Contraception		Question
Use or non-use prior to recent pregnancy		15
Reasons for non-use prior to recent pregnancy		16
Method used prior to most recent pregnancy		17
Use or non-use postpartum		58
Reasons for non-use postpartum		59
Method used postpartum		60
Postpartum contraceptive advice from health care workers		55c
Diabetes		Question
Preconception diabetes screening		7d
Pre-pregnancy type 1 or type 2 diabetes		11a
Gestational diabetes		31
Diet and physical activity		Question
Preconception dieting to lose weight		7a
Preconception physical activity 3x per week		7b

Domestic violence	Question
Discussion by prenatal care health workers of physical violence	22l
Pre-pregnancy physical violence by partner	40
During pregnancy, physical violence by partner	41
Drinking water contamination — Arsenic	Question
Testing well water before birth of baby	65
Health care worker advice to test well water	66
Testing for arsenic in well water done	67
Flu Vaccine	Question
12 months before birth of baby, health care worker advised flu vaccine	24
12 months before birth of baby, received flu vaccine	25
Month and year of flu vaccine	26
Head trauma	Question
Health care worker informed what happens if baby is shaken	55h
HIV	Question
Prenatal advice by health care worker to get tested for HIV	22j
During pregnancy, obtained HIV test	23
Home visiting	Question
Prenatal home visitor	29
Postpartum home visitor	57
Immunization — see Flu Vaccine	
Infant Status	Question
Infant in NICU	46
Infant alive now	48
Infant living with mother now	49
Insurance	Question
Type of insurance, pre-pregnancy	8
Type of insurance for prenatal care	21
Type of insurance postpartum	64
Insurance for dental care during pregnancy	27d
Insurance not accepted by prenatal health care provider	20l
Labor and delivery	Question
Labor induced	43
Reasons for labor induction	44
NICU admission	46
Length of hospital stay	47
Life stressors	Question
Various life stressors (illness, divorce, lost job, etc.)	39a-n

Maternal characteristics	Question
Age group	3
Pre-pregnancy BMI	1, 2
Weight gain during pregnancy	45
Mental Health	Question
Pre-pregnancy depression check	7f
Pre-pregnancy depression diagnosis	11c
Prenatal health worker advice on depression	22k
Health care worker advice about postpartum depression	55d
Health care worker advice about emotional pain	55j
Feeling down, depressed or hopeless	62
Little interest or pleasure in doing things	63
Nutrition	Question
Preconception use of vitamins or folic acid	9
Oral health	Question
Preconception teeth cleaning	7h
Oral health care during pregnancy (knowledge, services, need)	27a-f
Postpartum health care	Question
Postpartum checkup	61
Postpartum advice (various topics) from health care workers	55a-j
Postpartum home visitor	57
Preconception morbidities	Question
Prescription medication	7c
Hypertension screening	7e
Hypertension diagnosis	11b
Health care worker asked about family medical history	7g
Health care worker advice to improve health	10
Pregnancy history	Question
Previous live birth	4
Previous low birth weight birth	5
Previous preterm birth	6
Pregnancy intention	Question
How did you feel about becoming pregnant	12
How much longer did you want to wait to become pregnant	13
Were you trying to get pregnant	14
Husband or partner said he didn't want you to be pregnant	39j
Prenatal care	Question
Timing of first prenatal care visit	18
Started prenatal care as early as you wanted	19
Barriers to prenatal care	20a-l
Discussion topics by prenatal care health providers	22a-l

Help or advice to quit smoking by prenatal care health providers	68a-k
Classes to prepare for childbirth	28
Home visitor to help you prepare for new baby	29
Pregnancy intention	Question
How did you feel about becoming pregnant	12
How much longer did you want to wait to become pregnant	13
Were you trying to get pregnant	14
Husband or partner said he didn't want me to be pregnant	39j
Safety	Question
In cars	
Always used a seatbelt during pregnancy	69i
New baby always rides in a rear-facing infant car seat	69d
In homes	
Various safety issues	69a-i
Arsenic in drinking water	65,66,67
Socioeconomic Status	Question
Household income 12 months before baby was born	73
Number of persons dependent on household income	74
WIC participation during pregnancy	30
Sleep behaviors	Question
Baby stayed in mom's room at hospital	54b
Infant sleep position	56
Infant sleeps with others	70
Smoking	Question
Smoking in past 2 years	32
Smoking 3 months before pregnancy	33
Smoking last trimester	34
Current smoking	35
Help or advice to quit smoking by prenatal care health providers	22b, 68a-k
Social media	Question
Text messaging	71
Sources of information for pregnancy issues (traditional and social media)	72a-l
Violence - see Domestic Violence	
WIC	Question
WIC participation during pregnancy	30

Before Pregnancy

A combined three-year percentage estimate is reported for each indicator in the PRAMS survey.

Additionally, annual percentage estimates are provided for indicators in which the yearly confidence intervals show a significant difference by year, within either the LBW group or the NBW group; where yearly differences occur, text is *italicized* and cells are shaded.

NB: This data book presents findings stratified by birth weight (LBW, defined as low or very low vs. NBW, defined as normal or high). The findings show simple associations between various indicators and the birth weight outcomes, and are not intended to imply causal relationships. Causation cannot be considered without examining the effects of possible confounders such as plurality, preterm birth, small for gestational age, previous births (if any), maternal age, education, socioeconomic status, and the content and/or frequency of prenatal care, to name a few. Causation and the role of confounders are beyond the intended scope of this data book.

1. How tall are *you* without shoes?

2. *Just before you got pregnant with your new baby, how much did you weigh?*

Woman's height and weight are used to calculate BMI before pregnancy; BMI is calculated as weight in kilograms divided by the square of the height in meters (kg/m²).

BMI [MOM_BMIG_QX_REV]	Percent	95% CI		Yes	Population
	Yes	Lower	Upper	Responses	Estimate
LBW (n=708)					
Underweight, BMI 18.4 or less	4.7	3.6	6.2	34	95
Normal weight, BMI 18.5 to 24.9	53.5	50.4	56.5	377	1079
Overweight, BMI 25.0 to 29.9	20.5	18.1	23.1	145	414
Obese, BMI 30.0 or higher	21.3	18.9	23.9	152	430
NBW (n=1142)					
Underweight, BMI 18.4 or less	3.4	2.5	4.7	36	1161

PRAMS Data To Action: How Can PRAMS Data Be Used?

PRAMS is a valuable source for data that were not previously available on health indicators for mothers and very young infants. In addition to supporting grant proposals and evaluations for a variety of public health programs, New Hampshire PRAMS data has proven valuable for some creative projects that are being developed by stakeholders to address emerging issues and challenges within the state. These projects serve as examples that demonstrate a wide range of possibilities for using PRAMS to enrich efforts to improve the health of mothers and babies across the state and beyond.

Development of a Cell Phone Application for Pregnant and Parenting Women in Substance Addiction Programs

In a culture that is increasingly dependent on technology as a primary communication tool, stakeholders strive to adapt to new generations and methods of communication. NH PRAMS developed state specific questions on access to and use of texting among New Hampshire women of childbearing age; these data demonstrate the potential for using technology to reach women for health related messaging. The Dartmouth Perinatal Addiction Treatment Program used the NH PRAMS data on texting and major life stressors to support a successful grant proposal to fund a pilot program for the development of a digital platform (cell phone application) in 2017. The platform will assist pregnant and parenting women who are in addiction treatment programs in maintaining and documenting adherence to their Plan of Safe Care (PSC) for their infants, as required by federal law. The results of this pilot will be used to support additional funding proposals; project leaders believe that this technology has the potential to transform approaches to PSC development nationally.

Supporting Professional Development Opportunities for Providers Working with Patients on Tobacco Cessation

In its ongoing efforts to improve tobacco cessation and treatment strategies, the New Hampshire Tobacco Prevention and Cessation Program (NH TPCP) developed a series of video learning modules in 2017 to educate providers in the best strategies to help patients quit tobacco use. NH TPCP used PRAMS data on smoking during the perinatal period to inform the creation of a specific module on the unique needs of pregnant and parenting women. The modules are now available online to meet the professional development needs of providers across the state.

As NH PRAMS collects more years of data, the value to stakeholders increases with opportunities to track trends and emerging issues within the state, all with an eye toward using these data to develop and improve programs to address the health needs of mothers and infants and to support a healthy future for the citizens of New Hampshire.

Are you using NH PRAMS data? Do you have questions about the data or how it might help you develop or improve your program? We would love to hear from you whether you have questions or a story about how you have used the data.

Contact New Hampshire PRAMS:
Prams@dhhs.nh.gov / 603-271-2081

Using New Hampshire PRAMS Data

The following programs have used PRAMS data to support their work, some for a one-time project and many on an ongoing basis:

NH Governor's Commission on Alcohol and Drug Abuse Prevention Treatment and Recovery

Data on tobacco and alcohol use and other substance misuse.

To inform the Commission's strategic plan.

NH Oral Health Program

Data on oral health, income level, WIC enrollment.

For evaluation, report writing, and for a presentation for Northern New England Perinatal Quality Improvement Network (NNEPQIN) conference, November 2017.

NH Abusive Head Trauma Coalition

Data on infant crying, advice to sooth crying baby, and stressors.

For evaluation and planning; grant reporting.

NH Tobacco Prevention and Cessation Program (TCP)

Data on texting and social media use, tobacco use, breastfeeding, income, Medicaid participation, birthweight, conversations with providers, and life stressors.

To evaluate and plan new approaches to reach audience for the *Quitline*.

To develop educational video modules for providers.

Belknap-Merrimack CAP/WIC

Data on flu vaccination during pregnancy (Data Brief) and the PRAMS factsheet.

To include in packets for providers at WIC clinics.

NH Chronic Disease Program

Data on breastfeeding.

To update report on breastfeeding in New Hampshire.

Injury Prevention Center at Children's Hospital at Dartmouth (CHAD)/ Injury Prevention Advisory

Data on safety issues and provider conversation about soothing a crying infant.

For annual Injury Prevention Report.

Dartmouth Children's Environmental Health and Disease Prevention Research Center

Data on advice from providers and testing of private wells; data on maternal characteristics.

For research study on the association between maternal characteristics, provider patterns and water testing behavior.

Dartmouth-Hitchcock Perinatal Addiction Program

Data related to neonatal abstinence syndrome including stressors, alcohol and tobacco use, texting, income, and conversations with providers.

To support a successful grant to develop a digital platform (cell phone application) to assist pregnant and parenting women in addiction treatment programs monitor and adhere to their *Safe Plan of Care*.

Community Health Institute/ Maternal, Infant, and Early Childhood Home Visiting Program (MIECHV)

All PRAMS data.

To complete a needs assessment for MIECHV.

NH Maternal and Child Health Section

Data on Safe Sleep practices, tobacco use, alcohol use, postpartum depression, oral health, stressors, folic acid use in pregnancy.

For comparison to National Outcome Measures and National Performance Measures and to support grants for Safe Sleep programming, the Title V Maternal and Child Health Block Grant, the Home Visiting Program, and the Early Hearing Detection and Intervention (EHDI) program.
