Spread of COVID-19 can occur in workplaces and cause significant impact on employees and business operations. Even a single person can introduce COVID-19 into a workplace and lead to multiple other people needing to quarantine at home, which can significantly impact business operations. Businesses and employers can prevent and slow the spread of COVID-19 within the workplace by implementing recommended public health COVID-19 mitigation guidance (see NH Universal Best Practices). One important layer of protection to prevent introduction of COVID-19 into the workplace is effective employee screening to exclude people who have any new or unexplained symptoms of COVID-19 or risk factors for exposure, including international travel.

Travel Guidance for Employers

Many areas of the world, including within the United States, have high levels of COVID-19 which increases a person’s risk of COVID-19 for those who live in, or travel to these areas. At this time, New Hampshire residents are only required to quarantine after international travel, if not fully vaccinated, but should follow precautions following both international and domestic travel, outlined in NH DPHS’ general Travel Guidance. There are also new variants of concern that have emerged which are more infectious and easily spread. Different types of travel and activities (e.g., travel on public transportation, travel on cruise ships, interaction with large groups of people, etc.) increase a person’s risk of COVID-19 exposure, regardless of the ultimate destination. Therefore, employers should take the following steps to minimize the risk of an employee being exposed to COVID-19 during travel and subsequently introducing the novel coronavirus into the workplace:

- Avoid non-essential international and domestic business travel, especially travel that involves larger group activities and interactions (e.g., conferences, meetings)
- Discourage personal international travel or travel on cruise ships
- Recommend and incentivize COVID-19 vaccination for employees

Employee Illness and Risk Screening

- Facilities and businesses should consider asking screening questions to assess risk for COVID-19 daily before work, including the following:
  1. Do you have any symptoms of COVID-19 or fever of 100.4 degrees Fahrenheit or higher that are new for you? Symptoms of COVID-19 can include:
     - Fever, or feeling feverish;
     - Respiratory symptoms such as runny nose, nasal congestion, sore throat, cough, or shortness of breath;
     - General body symptoms such as muscle aches, chills, and severe fatigue;
     - Gastrointestinal symptoms such as nausea, vomiting, or diarrhea, and
     - Changes in a person’s sense of taste or smell.
  2. Have you had close contact with someone in the prior 10 days who has tested positive for COVID-19? (Note: healthcare workers caring for COVID-19 patients while wearing appropriate personal protective equipment should answer “no” because they are not considered to have exposure)
3. Have you traveled in the prior 10 days internationally (outside of the U.S., except for essential travel to/from Canada*) or on a cruise ship?

*Essential travel to/from Canada includes for work, school, personal safety, medical care, care of others, or parental shared custody. Essential travel also includes travel for students and their parents or guardians who are visiting institutions of higher learning or preparatory high schools as potential future students, including allowing the students to remain at the schools for overnight stays.

Employees with Symptoms of COVID-19 Should Stay Home and be Evaluated for COVID-19 Testing (regardless of prior infection or COVID-19 vaccination status)

Persons with any new or unexplained symptoms of COVID-19 (even if only mild symptoms) should not be allowed into the facility. Symptomatic persons should be instructed to contact their health care provider to be evaluated for testing for COVID-19 and self-isolate at home; this includes people who are previously vaccinated against COVID-19 or who had prior COVID-19. For people who do not have a primary care provider, or for whom a primary care provider does not/cannot test the person, the individual should seek COVID-19 testing at one of the many testing locations around NH.

A person with symptoms of COVID-19 can be allowed back to work if they meet criteria A, B, or C:

A. The person tests negative for COVID-19 with an appropriate test to detect active infection. Such persons can be allowed back to work when they are fever-free for at least 24 hours off fever-reducing medication with other symptoms improving as long as they have no risk factor for COVID-19 exposure for which the person should complete a period of quarantine even after testing negative (see quarantine guidance and “exceptions to quarantine requirements” below).

B. The person has immunity/protection against COVID-19 from being fully vaccinated against COVID-19 (i.e., person is 14 days or more beyond completion of a recommended COVID-19 vaccine series) or from recently being diagnosed with COVID-19 in the prior 90 days, and their healthcare provider has assessed their symptoms and determined they do not need testing for COVID-19 because of being low-risk for COVID-19 (based on symptoms and assessment of potential COVID-19 exposures). Such persons can be allowed back to work when they are fever-free for at least 24 hours off fever-reducing medication and other symptoms are improving.

C. The person has met CDC criteria for discontinuation of isolation (which applies to people who test positive for COVID-19, or for symptomatic people who are not tested but don’t have immunity/protection from vaccination or prior infection, as described above).

Employees with Risk Factors for COVID-19 Exposure Should Stay Home and “Quarantine”

Persons who report close contact to someone with COVID-19, or those reporting travel risk factors (as outlined above in the screening questions) should not be allowed into the facility, and they should be instructed to self-quarantine at home unless exceptions below apply.

A person can be allowed back to work when at least 10 days have passed from their last exposure to a person infectious with COVID-19, or return from international or cruise ship travel. Businesses and organizations serving vulnerable populations in congregate living settings that are high-risk for transmission (e.g., long-term care facilities, jails/prisons, etc.) are recommended to use a 14 day quarantine for residents and staff to minimize risk of transmission within
facilities and to minimize impact on vulnerable populations. In circumstances where an employer has more strict quarantine policies (i.e., requires a 14 day quarantine), staff should follow employer policies.

People who should quarantine due to international travel or travel on a cruise ship have the option of shortening their travel-related quarantine by getting a test on day 6-7 of their quarantine to test for active SARS-CoV-2 infection (SARS-CoV-2 is the novel coronavirus that causes COVID-19); this test should be a molecular test (e.g., PCR-based test); antigen tests are not very accurate when used as screening tests on people without symptoms. If the test is obtained on day 6-7 of quarantine (i.e., within 48 hours before ending quarantine after day 7), the person is asymptomatic, and the test is negative, then the person can end their quarantine after 7 days, but they should still observe for symptoms of COVID-19 and adhere to COVID-19 mitigation measures (social distancing, avoiding social gatherings, wearing a well-fitted face mask, practicing frequent hand hygiene, etc.) for a full 14 days after their last day of travel. Any new symptoms of COVID-19 should prompt the person to isolate and seek testing again (even if the person was recently tested and ended quarantine). This 7-day quarantine “test out” option should ONLY applies to travel-related quarantine (not quarantine due to a high-risk close contact exposure to a person with COVID-19).

People who are identified as close contacts to someone diagnosed with COVID-19 need to quarantine for at least 10 days and should themselves be tested, but testing for COVID-19 should not allow a person identified as a “close contact” to end their 10 day quarantine early; testing is only for the purpose of early identification of infection so that public health can perform contact tracing to identify additional people potentially at risk for COVID-19. Any person with an identified exposure who ends quarantine after 10 days should still monitor themselves daily for symptoms of COVID-19 and adhere to all recommended COVID-19 mitigation measures (social distancing, avoiding social gatherings, wearing a well-fitted face mask, practicing frequent hand hygiene, etc.) for a full 14 days after their last potential exposure. Any new symptoms of COVID-19 should prompt the person to isolate and seek testing again (even if the person recently tested out of quarantine).

Exceptions to Quarantine
The following people do NOT need to quarantine after close contact to a person with COVID-19 or after international or cruise ship travel:

1. Persons who are 14 days or more beyond completion of COVID-19 vaccination – this means a person should be at least 14 days beyond receipt of the second dose of either the Pfizer-BioNTech or Moderna COVID-19 vaccine, or at least 14 days beyond receipt of the single-dose Janssen (Janson & Johnson) COVID-19 vaccine.

2. Persons who are within 90 days of a prior SARS-CoV-2 infection that was diagnosed by PCR or antigen testing (if a person had a previous infection that was more than 90 days prior, then they should still follow the quarantine guidance).

Such persons, however, should still monitor themselves for symptoms of COVID-19 daily, practice social distancing, avoid social and other group gatherings, always wear a well-fitted face mask when around other people, and practice good hand hygiene. All infection control and other business COVID-19 mitigation guidance should be followed. For health care workers, this includes continuing to use all appropriate personal protective equipment (PPE) when evaluating or treating patients (including patients with suspect or confirmed COVID-19).

Additional exceptions can be made for employees who work in a critical infrastructure sector (see also CISA memo) AND are deemed essential to the functioning of the business (“essential worker”). Essential workers may be permitted to work during their quarantine period if all of the following criteria are met:

---

NH Department of Health and Human Services
Division of Public Health Services
Bureau of Infectious Disease Control

Employer Travel, Screening, and Exclusion Guidance
May 21, 2021
The employee is not exhibiting any signs or symptoms of COVID-19;
The employee is not a household contact to a confirmed case of COVID-19;
The employee is deemed essential to the functioning of the business and substantial business impact would be experienced if the employee does not work in person;
The employee cannot conduct essential functions remotely;
There is no replacement personnel for the employee;
The employee self-quarantines for all other purposes other than reporting to work;
The employee wears a well-fitted face mask, maintains at least 6 feet of separation from other employees and customers, and participates in daily health screening while at work.

An additional option for a critical infrastructure business experiencing significant staff shortages due to employees being out on quarantine resulting in inability to maintain operations, the business may also choose to implement SARS-CoV-2 molecular testing for essential employees to end quarantine after day 7 if all the following apply:

- An appropriate respiratory specimen is collected on days 6-7 of quarantine (i.e., within 48 hours before ending quarantine after day 7)
- The specimen is tested for the SARS-CoV-2 coronavirus by a molecular test (e.g., a PCR-based test) and is negative; antigen testing in asymptomatic persons is not accurate enough for this purpose
- The person remains asymptomatic
- The person conducts daily self-monitoring for symptoms for a full 14 days after last potential exposure
- The person strictly adheres to all recommended non-pharmaceutical interventions (social distancing, avoiding social gatherings, wears a well-fitted face mask, practices frequent hand hygiene, etc.) for a full 14 days after last potential exposure
- If the person develops symptoms of COVID-19, they should immediately isolate and seek out testing for COVID-19, even if that person has previously or recently tested negative

Specialized or technical workers who need to come to New Hampshire from other international locations to support critical infrastructure businesses can stay overnight in New Hampshire hotels without quarantining prior to arrival. They should follow the other guidance above pertaining to mask wearing and social distancing while at work and in public settings (e.g., transiting through their hotel, getting take-out food, etc.), and they should quarantine and stay out of public settings when not working.

Healthcare workers and employers should follow CDC’s healthcare worker-specific guidance, and should refer to NH DPHS guidance on Criteria for Return to Work and Crisis Staffing in Long Term Care Facilities and Other Health Care Settings, which can be applied to healthcare settings to address crisis staffing levels.
## Isolation and Quarantine Summary

<table>
<thead>
<tr>
<th>Employee Symptom/Test Status</th>
<th>Close Contact to someone with COVID-19 in past 14 days</th>
<th>Traveled internationally or by cruise ship</th>
<th>No Travel or Travel within the U.S.</th>
</tr>
</thead>
</table>
| **New or unexplained symptom of COVID-19** | Isolate and get tested immediately.  
If negative [Self-Quarantine](#) for 10 days from last day of exposure  
See “exemptions to quarantine requirements”  
(household contacts need to quarantine unless working in a healthcare setting under crisis standards of care guidance, but such persons should follow all other guidance) | Isolate and get tested immediately.  
If negative the person can return to normal activities once they are at least 24 hours without a fever (off fever-reducing medications) and other symptoms are improving. AND any one of the following criteria apply:  
1. Person is at least 14 days beyond completion of COVID-19 vaccination, or person previously tested positive for active COVID-19 in the prior 90 days  
2. Person completes 10 days of self-quarantine from last day of travel  
3. Travel was “essential travel” to/from Canada*  
4. Person ends quarantine after day 7 with a negative SARS-CoV-2 molecular test (e.g., PCR-based test) collected on day 6-7 of quarantine  
(Note: If person was tested before days 6-7 of quarantine due to symptoms and was negative, then a second test on day 6-7 should still be obtained to end quarantine after 7 days.)  
If traveler is designated as an essential critical infrastructure employee, then person can return to work when they are at least 24 hours without a fever (off fever-reducing medications) and other symptoms improving, but they should quarantine for all other non-work related purposes following the quarantine guidance. | Isolate and get tested immediately.  
If negative the person can return to normal activities after at least 24 hours without a fever (off fever-reducing medications) and other symptoms improving.  
(Note: For travelers designated as essential critical infrastructure employees, if they test negative after 7 days of quarantine, they can return to work when they are at least 24 hours without a fever (off fever-reducing medications) and other symptoms improving, but they should quarantine for all other non-work related purposes following the quarantine guidance.)  
If person was designated as an essential critical infrastructure employee, then person can return to work when they are at least 24 hours without a fever (off fever-reducing medications) and other symptoms improving, but they should quarantine for all other non-work related purposes following the quarantine guidance. |

* Essential travel to/from Canada includes for work, school, personal safety, medical care, care of others, or parental shared custody. Essential travel also includes travel for students and their parents or guardians who are visiting institutions of higher learning or preparatory high schools as potential future students, including allowing the students to remain at the schools for overnight stays.

What is the difference between Isolation and Quarantine?

Isolation applies to people who are sick or infected with the novel coronavirus causing COVID-19; and quarantine applies to people who have been potentially exposed and are at risk of becoming infected. They both mean a person needs to stay home away from others, but the time required for each differs.
