

New Hampshire STD/HIV Surveillance Program 5 Year Data Summary Report 2014-2018

Data Notes:

All Data in this report are based upon information provided to the New Hampshire Department of Health and Human Services under specific legislative authority. The numbers may represent an underestimate of the true absolute number and incidence rate of cases in the state. Any release of personal identifying information is conditioned upon such information remaining confidential. The unauthorized disclosure of any confidential medical or scientific data is a misdemeanor under New Hampshire law. The department is not responsible for any duplication or misrepresentation of surveillance data released in accordance with this guideline. Population data used in this report come from the most recently available U.S. Census Bureau population estimates. Historical data in this report may differ from previously released data due to ongoing quality assurance activities and receipt of new surveillance information. Data in this report are complete as of May 10, 2019.

1: Case rate per 100,000 persons. Case rates calculated for events <20 are considered statistically unreliable and should be interpreted with caution.

The Infectious Disease Surveillance Section restricts the release of calculated rate data to cell sizes ≥ 5 cases.

2: Other/Unknown race category includes multi-racial.

3: Hispanic ethnicity may be of any race.

4: NC= Not Calculated. As most STD cases have an unknown HIV status, data regarding HIV co-infection is considered incomplete. Rates are not presented due to incomplete data.

5: PLWHA= People living with HIV/AIDS.

6: County and city data is based upon residence at time of disease diagnosis.

7: Infectious syphilis includes cases diagnosed during the primary, secondary, and early non-primary non-secondary stages of syphilis infection in accordance with the CDC case definition. It excludes congenital syphilis and cases of unknown duration or diagnosed during late stage infection.

8: MSM= Male-to-male sexual contact. IDU = Injection drug use. Perinatal= Mother with or at risk for HIV. NRR= No reported risk. NIR= No identified risk. Heterosexual Contact=Specific heterosexual contact with a person known either to have or to be at high risk for HIV infection.

9: Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

10: Indicates a new diagnosis of AIDS in the specified year, regardless of when diagnosed with HIV.

Data sources: Patient Reporting Investigating Surveillance Manager (PRISM), enhanced HIV AIDS Reporting System (eHARS), and Environmental Systems Research Institute (ESRI) ArcMap.

New Hampshire STD/HIV Surveillance Program

5 Year Data Summary Report

Highlights, 2014 - 2018

Chlamydia

1. Chlamydia case counts have remained relatively stable while gonorrhea and syphilis counts have continued to increase.
2. Persons under age 30 and females of any age represent the populations most affected.
3. Highest rates of disease have historically been found in southern NH, but increased rates were more widely dispersed in 2018.

Gonorrhea

1. An increase in overall case count was observed beginning in 2014, with outbreak status declared in 2016. Case counts continue to increase.
2. Gonorrhea is most commonly diagnosed in persons 20-39 years old and men of any age. Hillsborough County, specifically City of Manchester, bears the highest burden of disease.
3. Thirty-six percent of reported cases of gonorrhea in 2018 were diagnosed at Emergency Departments or Urgent Care Facilities.

Infectious Syphilis⁷ (Primary, Secondary, and Early Non-Primary Non-Secondary)

1. Case counts were stable between 2012 and 2015, with an increase observed beginning in 2016 and outbreak status declared in 2017.
2. Gay and bisexual men and other men who reported male sex partners, as well as men living with HIV, are disproportionately affected by infectious syphilis.
3. NH reported 1 case of congenital syphilis in 2018. This was the first congenital syphilis case reported in NH since 2013.

Human Immunodeficiency Virus Infection (HIV)

1. The number of persons per year newly diagnosed with HIV in NH remains relatively stable.
2. Increases were noted in 2017-2018 in the proportion of new cases reporting any injection drug use as well the proportion reporting injection drug use as their primary identified risk.
3. Gay and bisexual men and other men who reported male sex partners remain the population most affected by HIV.

Acquired Immunodeficiency Syndrome (AIDS)

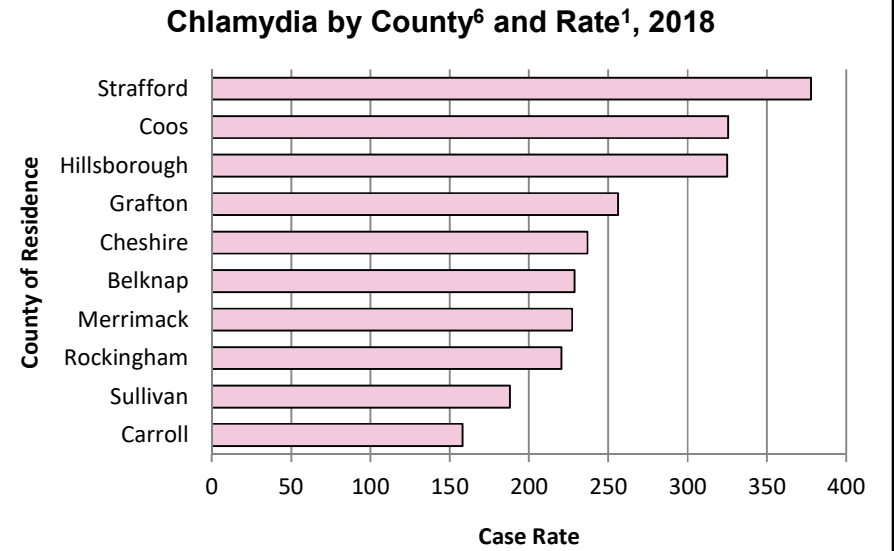

1. The number of persons per year newly diagnosed with AIDS in NH remains relatively stable.
2. From 2014-2018, 25% of persons newly diagnosed with HIV were concurrently diagnosed with AIDS (that is, received an AIDS diagnosis within 12 months of their HIV diagnosis). Concurrent diagnosis indicates missed opportunities for prevention, testing, and treatment.
