

New Hampshire Coronavirus Disease 2019 Weekly Call for Healthcare Providers and Public Health Partners

June 24, 2021

Elizabeth Talbot Beth Daly

Thursday noon-time partner calls will focus on science, medical, and vaccine updates geared towards our healthcare partners

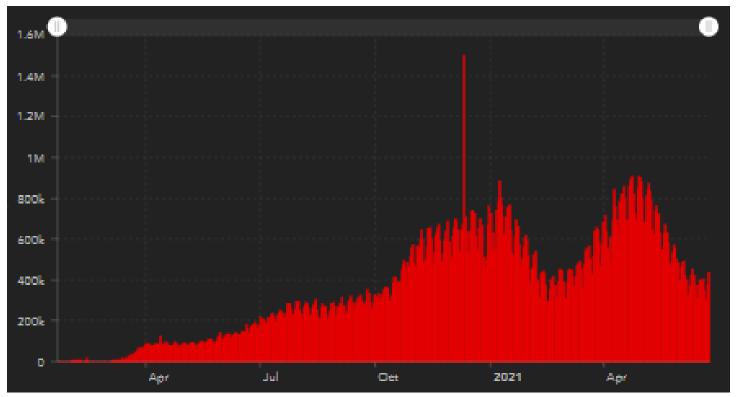

Agenda

- Epidemiology update
- Updated mask & quarantine guidance
- Diagnostics update and other tidbits
- Questions & Answers (Q&A)

Global Epidemic Curve

• 179.7 million cumulative cases

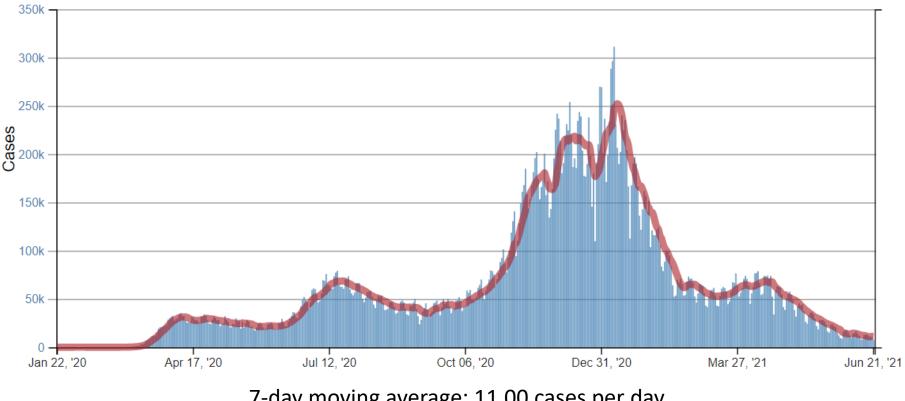

400 – 450K cases per day

U.S. Epidemic Curve

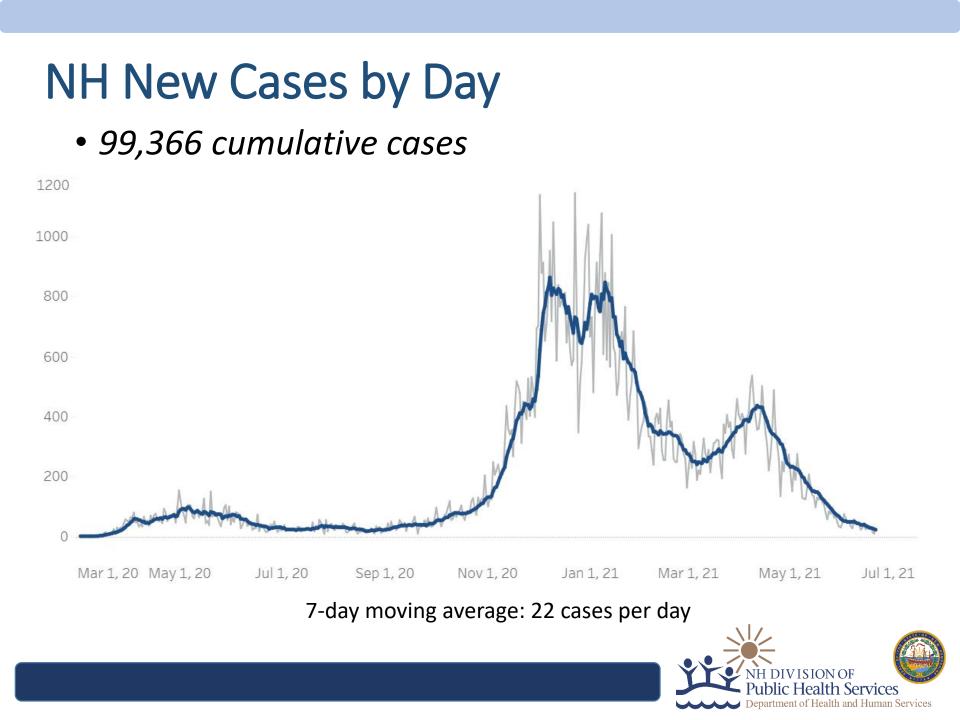

(new cases per day)

• 33.6 million cumulative cases

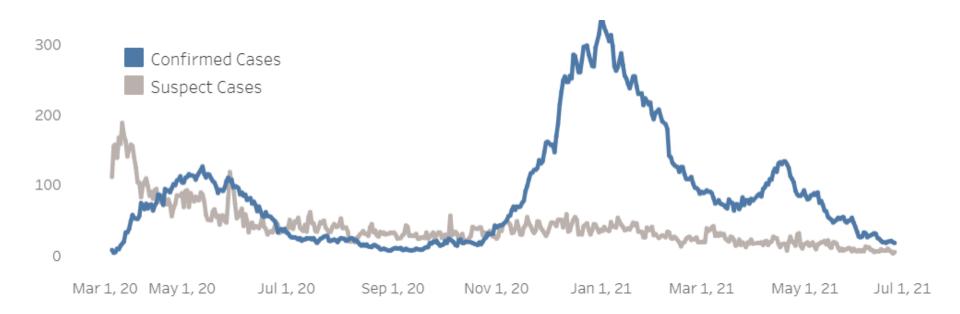

7-day moving average: 11,00 cases per day

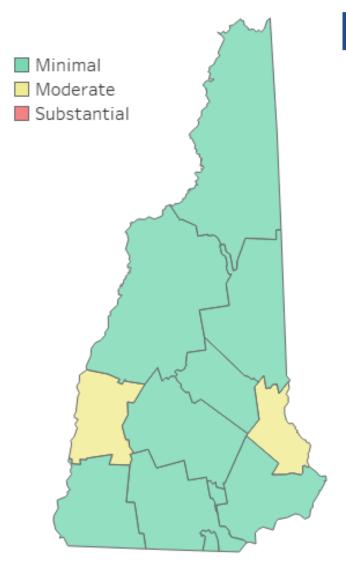

NH Hospitalizations

Current: 14

Community Level Transmission Metrics - Statewide (Not School Specific)				
Level of Transmission	New Cases per 100k over 14 days	7-Day Total Test Positivity Rate		
Minimal	28.8	0.9%		

Decreasing Community Transmission

Updated Mask Guidance

- Part of continued and phased de-escalation of COVID-19 mitigation measures
- People who are not symptomatic can choose to go without face masks in most locations
- Face masks still generally recommended for people in the following circumstances when in public locations:
 - Anyone who wants maximal protection
 - Immunocompromised persons
 - Persons at increased risk of getting and spreading COVID-19 when in high-risk locations
 - $_{\odot}$ When a business/organization requires it
 - E.g. Public transportation and healthcare settings

Updated Quarantine Guidance

- Quarantine following an exposure to COVID-19 is only required for:
 - <u>Household contacts</u> (notified by DHHS)
 - International and cruise ship travelers
 - Residents in some higher risk settings (notified by setting)
 - Some higher risk settings, such as <u>healthcare workplaces</u>, may still exclude unvaccinated staff members from work following an exposure.
 - Workplaces may exclude unvaccinated staff from work following exposure if the workplace is experiencing an <u>uncontrolled outbreak.</u>

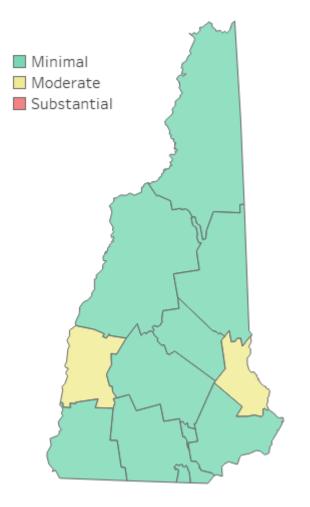

Non-household contacts

- NH DHHS will not notify non-household contacts.
- We encourage people diagnosed with COVID-19 to tell their non-household close contacts that they may have been exposed.
- Non-household contacts should:
 - Monitor themselves for any potential symptoms of COVID-19 and stay home and get tested should any develop
 - Consider keeping a distance of 6 feet from others and wearing a face covering when outside their home to protect others in case they develop symptoms of COVID-19

Why now?

- More than half of the NH population has been fully vaccinated
- Community transmission is low
- COVID-19 is likely here to stay, strategy will be to manage not necessarily contain, like other respiratory viruses
- 95% of close contacts quarantined are not known to test positive following exposure

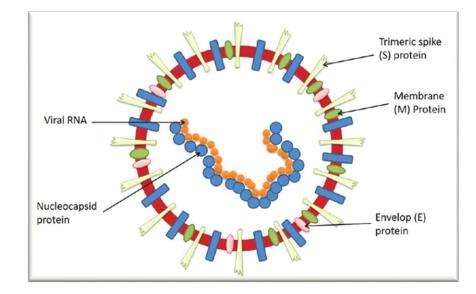

NH Contact Tracing Data

- Out of 88,000 named close contacts, only 4% went on to test positive for COVID-19
 - 3% of non-household contacts
 - 6% of household contacts
- Consistent with <u>data</u> from other jurisdictions, which reported 4% of close contacts tested positive
- When considering whether the close contact was tested, the proportion of that test positive is higher
 - \circ 13% overall
 - 8% non-household contacts
 - 28% household contacts

Targets for Testing

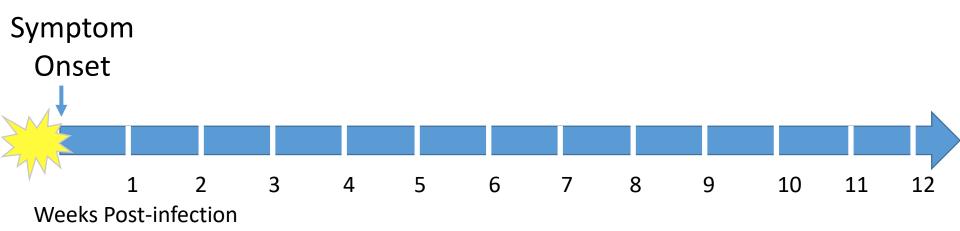

- 1. Live virus
- 2. Virus' genetic material
- 3. Virus' proteins
- 4. Patient's response to virus

Timing for Utility of PCR

RNA Detected

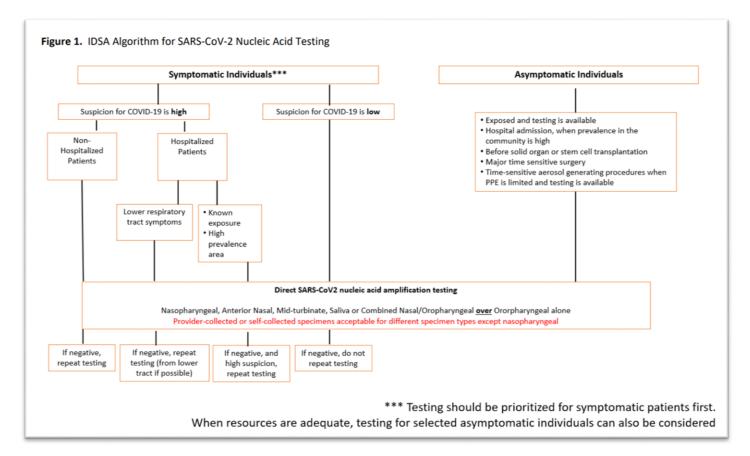

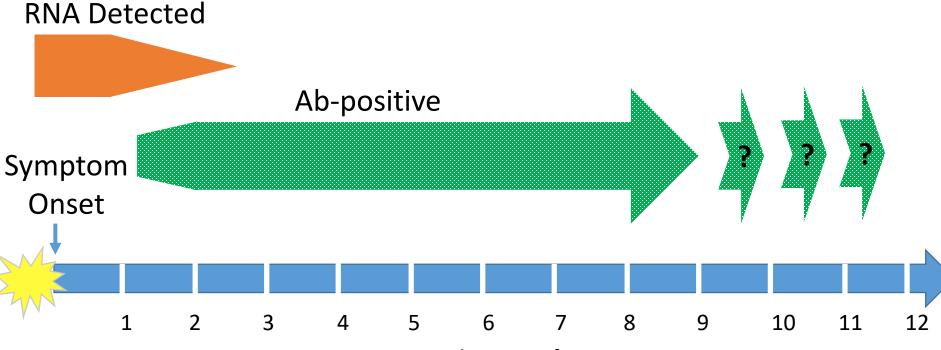

Lab-based PCR Remains GOLD STANDARD

IDSA Molecular Testing Guidelines

Minimal Role for Antibody Testing

Weeks Post-infection

IDSA Serology Guidelines

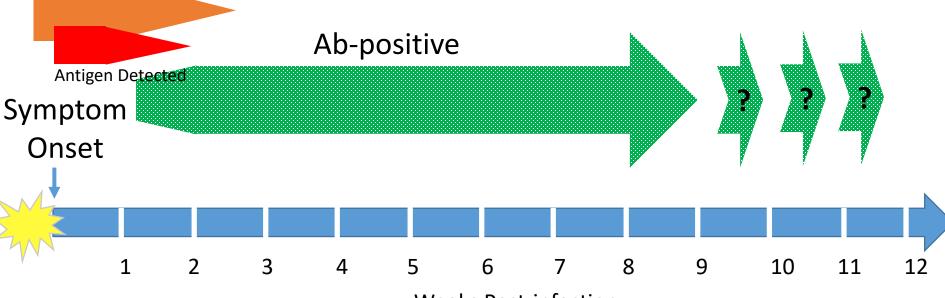

- Recommendation 1: The IDSA panel suggests against using serologic testing to diagnose SARS-CoV-2 infection during the first two weeks (14 days) following symptom onset (conditional recommendation, very low certainty of evidence).
- Recommendation 2: When SARS-CoV-2 infection requires laboratory confirmation for clinical or epidemiological purposes, the IDSA panel suggests testing for SARS-CoV-2 IgG or total antibody three to four weeks after symptom onset to detect evidence of past SARS-CoV-2 infection (conditional recommendation, very low certainty of evidence).
 - **Remark** When serology is being considered as an adjunct to NAAT for diagnosis, testing three to four weeks postsymptom onset maximizes the sensitivity and specificity to detect past infection.
 - Remark Serosurveillance studies should use assays with high specificity (i.e., ≥99.5%), especially when the
 prevalence of SARS-CoV-2 in the community is expected to be low.
- Recommendation 3: The IDSA panel makes no recommendation either for or against using IgM antibodies to detect evidence of past SARS-CoV-2 infection (conditional recommendation, very low certainty of evidence).
- Recommendation 4: The IDSA panel suggests against using IgA antibodies to detect evidence of past SARS-CoV-2 infection (conditional recommendation, very low certainty of evidence).
- Recommendation 5: The IDSA panel suggests against using IgM or IgG antibody combination tests to detect evidence of past SARS-CoV-2 infection (conditional recommendation, very low certainty of evidence).
 - **Remark** dgm or IgG combination tests are those where detecting either antibody class is used to define a positive result.

Recommendation 6: The IDSA panel suggests using IgG antibody to provide evidence of COVID-19 infection in symptomatic patients with a high clinical suspicion and repeatedly negative NAAT testing (weak recommendation, very low certainty of evidence).

- Remark When serology is being considered as an adjunct to NAAT for diagnosis, testing three to four weeks postsymptom onset maximizes the sensitivity and specificity to detect past infection.
- Recommendation 7: In pediatric patients with multisystem inflammatory syndrome, the IDSA panel suggests using both IgG antibody and NAAT to provide evidence of current or past COVID-19 infection (strong recommendation, very low certainty of evidence).
- Recommendation 8: The IDSA panel makes no recommendation for or against using capillary versus mous blood for serologic testing to detect SARS-CoV-2 antibodies (knowledge gap).

Ag: POC, Performance Tradeoff

Weeks Post-infection

IDSA Antigen Testing Guidelines

High specificity (>99%)

No need to reflex for a positive antigen test

Complicated Guidelines for Antigen Tests

G

Variable sensitivity. Pooled: 84% symptomatics within 7d onset 62% after 7d symptom onset 49% asymptomatics

For symptomatic, use NAAT over antigen tests

Single NAAT better than 2 consecutive antigen test strategy

Note 18 min podcast

"Should We Accept Home Tests?"

- DHHS accepts and responds to verbal reports of positive FDA-approved tests, as long as we know:
 - o Name
 - o DOB
 - o Phone
 - Date of test
 - Name of test
- DHHS does not accept negative results

Drivers of Emergence of COVID-19

- May 2017-Nov 2019 <u>study</u> of live animals in 17 Wuhan wet markets found >47,000 animals from 38 different species, including 31 protected
 - No bats or pangolins
 - Animals were often kept in poor, unhygienic conditions
- Although China banned wildlife, Chinese eating culture known as "jinbu," (進補) means 'to fill the void'
 - More "jinbu" benefits are reaped from eating an animal (especially wild animal) whose blood and energy ran high or killed just before serving
 - Drives exotic offerings in wet markets

Start of US Epidemic

Pooling from a bank of samples collected from patients with respiratory illness, SARS-CoV-2 RNA was identified from specimens collected in NYC as early as Jan 25, 2020, and increased prior to recognized surge

Sporadic SARS-CoV-2 infections occurred month before first documented case and emergence of NYC as epicenter in March 2020

Parallel in other large US cities is a reflection of lack of available diagnostics

May 31 WHO Announced Name Change

WHO Situation Report 8 June

WHO label	Pango lineage	GISAID clade	Nextstrain clade	Earliest documented samples	
Variants of Concern (VOCs)					
Alpha	B.1.1.7	GRY (formerly GR/501Y.V1)	20I/501Y.V1	United Kingdom, Sep-2020	
Beta	B.1.351	GH/501Y.V2	20H/501Y.V2	South Africa, May-2020	
Gamma	P.1	GR/501Y.V3	20J/501Y.V3	Brazil, Nov-2020	
Delta	B.1.617.2	G/452R.V3	21A/S:478K	India, Oct-2020	

Note CDC now classifies Delta as VOC not VOI

Delta Variant Emergence

- >80 countries
- >60% of infections in UK
- As of June 15, >10% of US infections
 - \circ 6% Region 1
 - 14 cases in NH

DON'T RISK IT

The new strain of coronavirus is easier to catch and easier to pass on Let's keep going and slow the spread of Covid-19

Focus on Impact of Delta

WHO label	Delta		
Transmissibility	Increased transmissibility and		
	secondary attack rate ^{4,5,}		
Disease severity	Not confirmed, possible increased		
	risk of hospitalization ¹¹		
Risk of reinfection	Reduction in neutralizing activity		
	reported ²¹		
Impacts on	None reported to date		
diagnostics			
Impacts on vaccine	Protection retained against severe		
efficacy/effectiveness	disease; possible reduced		
	protection against disease and		
	infection; limited evidence on		
	only two vaccines		
	Severe disease: No/minimal		
	loss: PfizerBioNTech-		
	Comirnaty, AstraZeneca-		
	Vaxzevria ^{31,40}		
	 Symptomatic disease: 		
	No/minimal to modest loss:		
	PfizerBioNTech-		
	Comirnaty ^{41,42} ; no/minimal to		
	moderate loss: AstraZeneca-		
	Vaxzevria ^{41,42}		
	 Infection: No/minimal to 		
	moderate loss: AstraZeneca-		
	Vaxzevria, PfizerBioNTech-		
	Comirnaty ⁴² ;		
Impacts on neutralization	 No/minimal loss: Bharat- 		
(full vaccination)	Covaxin ⁷¹		
by vaccine	 No/Minimal to moderate 		
	loss: Pfizer BioNTech		
	Comirnaty, Bharat-		
	Covaxin ^{64,85,86}		
	 Substantial loss: single 		
	dose of AstraZeneca-		
	dobe of riscideenced		

Emerging Messaging Re: Delta

Summary

- More transmissible
- More severe disease
- Higher risk of hospitalization
- US vaccines show effective

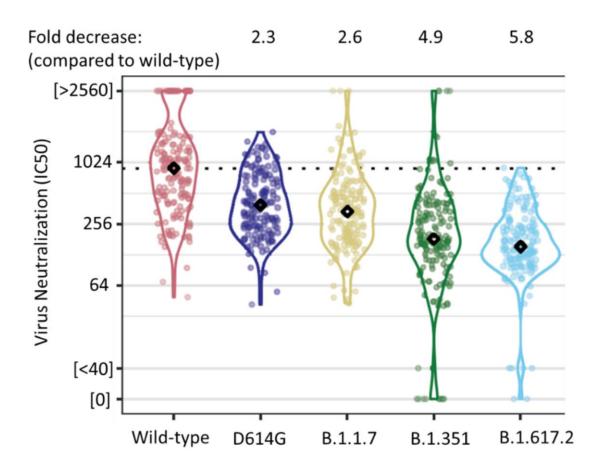

PHE Vaccine Study

- 2 doses of Pfizer 88% effective against symptomatic disease c/w 93% against Alpha
- 1 dose 33% protection
- Higher levels of effectiveness expected against hospitalization and death

<u>Neutralizing</u> <u>Antibody</u> <u>Study</u>

- Serum samples from longitudinal study among UK HCPs (n = 250) in January 2021 tested for neutralization against wild-type and variants
 - Pfizer 1 dose (n = 149) or 2 doses (159)
- 2 doses decreased neutralizing antibody titers against variants compared to wild-type
 - Alpha 2.6-fold (95% Cl 2.2-3.1)
 - Beta 4.9-fold (95% CI 4.2-5.7)
 - Delta 5.8-fold (95% Cl 5.0-6.9)

Worse with single dose: Below the limit of detection for Beta and Delta

Delta in Scotland

Alpha has been rapidly replaced by Delta

• S gene negative vs S gene positive on TaqPATH RT-PCR

Analyzed national COVID-19 surveillance platform EAVE II including 5.4M (99%) Scotland population from April 1-June 6

19,543 infections, 377 hospitalized

- SGP 39.5% of cases, 35.3% of hospitalizations
- Mainly in younger, more affluent groups

Risk of hospitalization doubled in those with Delta compared to Alpha, especially in those with underlying medical conditions

AstraZeneca vaccine appeared less effective than Pfizer vaccine in preventing SARS-CoV-2 infection in those with Delta

So What?

Higher transmissibility can make social distancing less successful

Higher severity can lead to severe outbreaks in unvaccinated communities

Risk for infection especially high for those who didn't get second mRNA Delta+lowvax=further mutations: potential for breakthrough infections favors potential of further mutation to evade protection of vaccines, acc <u>US CDC Director Dr. Rochelle</u> <u>Walensky</u>

Myocarditis and Pericarditis Update

FOR IMMEDIATE RELEASE June 23, 2021 Contact: HHS Press Office 202-690-6343 <u>media@hhs.gov</u>

Statement Following CDC ACIP Meeting from Nation's Leading Doctors, Nurses and Public Health Leaders on Benefits of Vaccination

"The facts are clear: this is an extremely rare side effect, and only an exceedingly small number of people will experience it after vaccination. Importantly, for the young people who do, most cases are mild, and individuals recover often on their own or with minimal treatment. In addition, we know that myocarditis and pericarditis are much more common *if you get COVID-19*, and the risks to the heart from COVID-19 infection can be more severe."

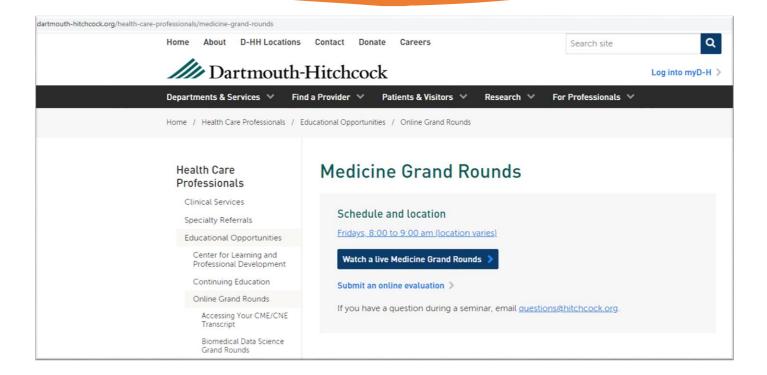

"Especially with the troubling Delta variant increasingly circulating, and more readily impacting younger people, the risks of being unvaccinated are far greater than any rare side effects from the vaccines..."
